SnapShot-Mobile

Snapshot on **YOUR** Mobile device!

Snapshot-Mobile software allows the pilot to operate the Track'Air's Flight Management System (FMS) using their very own mobile device. Snapshot-Mobile is used as a Pilot (client) device which wirelessly connects to the Navigator (server) system such as the

NexTrack system (MS Surface combined with TECI). This platform independent software can be installed on any iPhone 5s, iPad Mini (Gen2) and Microsoft Surface Pro computer.

By third quarter 2014, Windows Phone (8.0+) and Android (4.0+) will also be supported. This technology allows for new ways of viewing information such as 3-D flight perspectives. Multiple devices can be run simultaneously for large flight crews.
